**EFFECT OF LEAVES EXTRACT OF IPOMOEA CAIRICA ON  
CHLOROPHYLL AND CAROTENOID IN PARTHENIUM  
HYSTEROPHOROUS L.**

**ABSTRACT**

*Photosynthetic effects of the leaves extracts from Ipomoea cairica on Parthenium hysterophorus L were studied. Ipomoea cairica dried leaf powder (20g) was dissolved in distilled water (200ml) for foliar application. The seedlings were maintained under natural condition in Insect free net house. The experiment was carried out to analyze the effects of Ipomoea cairica leaves extract by measuring chlorophyll 'a', chlorophyll 'b', total chlorophyll and carotenoid contents in Parthenium. The experimental plants were sprayed 20 days after emergence and control plants were maintained by a simultaneous spray of distilled water. Leaves of Parthenium hysterophorus were collected at 5 days interval following the foliar application of Ipomoea cairica leaves extract up to 15th day. Results showed that Chlorophyll (total chlorophyll, chlorophyll a and b) and carotenoid content was adversely affected as the duration of Ipomoea cairica leaves extract increased. This potential of Ipomoea cairica can be used as herbicide to control noxious weed Parthenium hysterophorous.*

**1. INTRODUCTION**

Weeds are among the main components of the agro-ecosystem that interfere in crop production [1]. They compete for resources, reducing production, and can deposit a high quantity of seeds in the soil, perpetuating the problem during future plantings [2]. Excessive use of synthetic herbicides can cause pollution of soil and water [3] Natural compounds have some advantages over synthetic compounds, such as absence of halogen molecules and a shorter half-life [4]. Natural products, allelochemicals and plant extracts cannot provide the same level of weed control when compared to synthetic herbicides, but they can be worthwhile when only a small

quantity of herbicide can be used [5]. *Parthenium hysterophorus* is a noxious weed found throughout India. *Ipomoea cairica* leaves extract has been found to affect adversely against the growth of *Parthenium hysterophorus* due to decrease in chlorophyll content and enzyme activity [6]. This property of *Ipomoea cairica* can be used as natural herbicide to control *Parthenium hysterophorus*.

*Ipomoea cairica* is a perennial species of the Convolvulaceae that is widely distributed in tropical regions [7, 8]. The chemical nature of its secondary metabolites has been examined and two compounds, 3-3'-5-Trihydroxi-4'-7-dimethoxyflavone and 3-3'-5-Trihydroxi-4'-7-dimethoxyflavone-3-O-sulphate, were identified as being responsible for its allelopathic properties on radish (*Raphanus sativus* L.), cucumber (*Cucumis sativus* L.), Chinese cabbage (*Brassica pekinensis*) and a weed *Ligularia virgaurea*, making it a possible candidate for the development of new herbicides based on natural products[8,9]. The aim of this study was to evaluate the activity of aqueous leaf extracts of *Ipomoea cairica*, on the chlorophyll and carotenoids of *Parthenium hysterophorus* L.

## 2. MATERIAL AND METHODS

Pot culture experiment was conducted with freshly young seedlings of *Parthenium hysterophorus* L (Congress Grass). This species are common and dominant in the fields in the surrounding area of Gorakhpur. Administratively the study area (~10,000 km<sup>2</sup>; 27°05' to 27°40' N latitudes and 83°30' to 84°E longitudes) falls in Gorakhpur district of UP state. It is bounded by Nepal in the north and Bihar state of India in the east. The weed seeds were collected from the University campus. Seeds were soaked in the seed pan for 2 days to obtain maximum germination percentage. After 20 days, the plantlets were sown in the experimental pots containing soil supplemented with farmyard manure in the ratio of 1:3. The seedlings were maintained under natural condition

## 3. EXTRACT PREPARATION

Fresh leaves of *Ipomoea cairica* were collected from D.D.U Gorakhpur University campus, Gorakhpur. Leaves were washed properly with water and shade dried for 15 days. After drying the leaves was powdered using a mechanical grinder and were stored in air tight containers at -10°C for further studies. Aqueous extracts of *Ipomoea cairica* were prepared as 20g of leaves were soaked in 200 mL distilled water (10%), and kept at room temperature of 28–30°C. After 24 h the aqueous extracts were filtered through four layered cheese cloth and stored at 6 °C and tested their effects on pigment content of *Parthenium hysterophorus*. In the present study only 20-22 days old seedlings of *Parthenium hysterophorus* were treated with *Ipomoea cairica* leaves extract. The control plants were maintained by a simultaneous spray of distilled water. Pot culture experiments were conducted in the Department of Botany, D.D.U. Gorakhpur University, Gorakhpur, U.P, India.

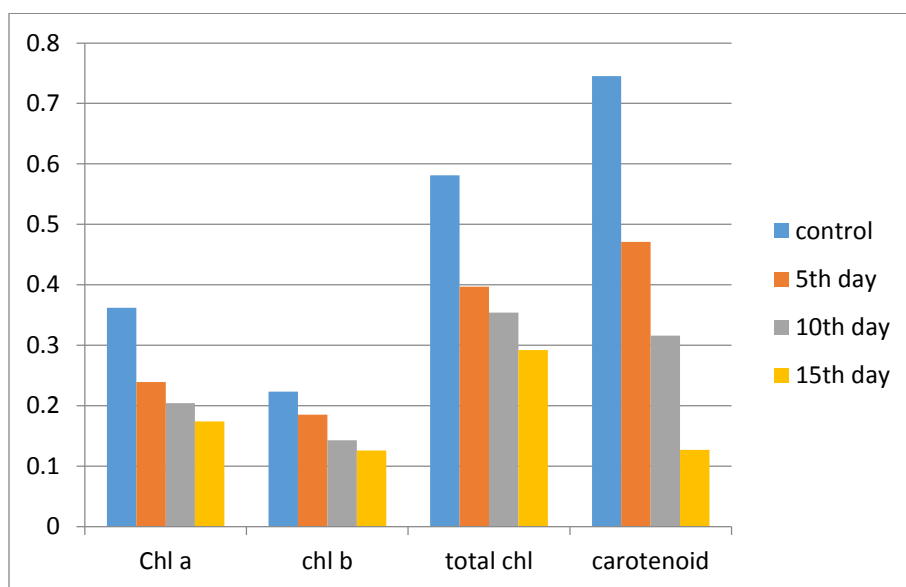

## 4. SAMPLING

Leaves of *Parthenium hysterophorus* were collected at 5days interval following the foliar application of *Ipomoea cairica* upto 15<sup>th</sup> day. The leaves were thoroughly washed first with tap

water followed by distilled water and were dried with filter paper. Fresh leaf material was used for the determination of chlorophyll and carotenoids. The chlorophyll content was estimated according to the method of [10], Total carotenoids were determined as per the method of Jensen and Jensen [11]. Data were expressed as Mean  $\pm$  Standard deviation of mean (SD).

## 5. RESULT AND DISCUSSION

The objective of present work was to study the effect of *Ipomoea cairica* leaves extract on chlorophyll fractions like chlorophyll 'a', chlorophyll 'b', total chlorophyll and carotenoid on leaves of *Parthenium hysterophorus*. The results of this study showed that, the control plants chlorophyll content was more in *Parthenium hysterophorus*, but the *Ipomoea cairica* leaves extract treatment caused decrease in all the plants up to 15<sup>th</sup> day over the control respectively in the *Parthenium hysterophorus*. Thus, the chlorophyll 'a' content is decreased significantly in the treated *Parthenium hysterophorus* (0.362, 0.239, 0.204, 0.172) (Tab.1, Fig 1). The treated plants showed that the gradual decrease in chlorophyll 'b' content in all the stages of experimental days. The maximum decrease was noticed in the weed plants on 15<sup>th</sup> day. The decreased levels chlorophyll-b was observed in *Parthenium hysterophorus* (0.223; 0.185; 0.143; 0.126) on 5<sup>th</sup>, 10<sup>th</sup> and 15<sup>th</sup> day respectively over the control (Tab.2, fig 1). The results revealed that the total chlorophyll content was continuously decreased up to 15<sup>th</sup> day in *Parthenium hysterophorus* over the control. The reduction in chlorophyll a, chlorophyll b and total chlorophyll contents in 15 days treated leaves is nearly 50% over control in both the cases. However, the weed species showed consistent decrease at all the experimental days. The result was similarly compared with several reporters work on effect of herbicide [12]( Peter J.Ralph,2000) The content of total carotenoid was also reduced with effect of *Ipomoea cairica* leaves extract caused gradual decreased carotenoid content in the weed species up to 15<sup>th</sup> day. The maximum declined was noticed on 15<sup>th</sup> day only. The decreasing level of carotenoid content in *Parthenium hysterophorus* (0.745, 0.471, 0.316, 0.127) (Tab.4, Fig 1) when compare to control.

**Table 4:** Effect of *Ipomoea cairica* leaves extract on carotenoid content in weed species (mg/g.fwt)

Name of the weed species	Days after treatment			
	Control	5 <sup>th</sup> day	10 <sup>th</sup> day	15 <sup>th</sup> day
<i>Parthenium hysterophorus</i> L.	0.745 ± 0.094	0.471 ± 0.147	0.316 ± 0.084	0.127 ± 0.0719

± SD Values are mean of 5 replications

## 6. CONCLUSION

The present study concluded that *Ipomoea cairica* leaves extract has a strong effect on *Parthenium hysterophorus*, effects are directly related to changes in the total chlorophyll and carotenoid content. Similarly chlorophyll 'a' and chlorophyll 'b' contents were also decreased significantly in the weed upto 15<sup>th</sup> day. Carotenoid content was also declined in the weed species might have contributed to the photo oxidation of chlorophylls. The degradation of chlorophyll and carotenoid content in the present study testifies *Ipomoea cairica* leaf extract action on photosynthetic activity. This property of *Ipomoea cairica* can be utilized to control the noxious weed *Parthenium hysterophorus*.

## 7. ACKNOWLEDGEMENT

Dr. Deepa Srivastava is thankful to UGC, New Delhi for awarding post-doctoral fellowship.
